Clustering algorithms

2IMW30 - Foundations of data mining TU Eindhoven, Quartile 3, 2016-2016

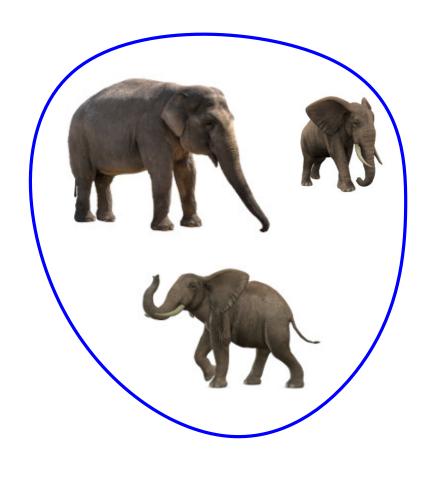

Anne Driemel

Overview of this lecture

- Clustering
- Facility Location
- Gonzales' algorithm
- Lloyd's algorithm (k-means)
- k-means++ algorithm
- Clustering in graphs

What is Clustering?

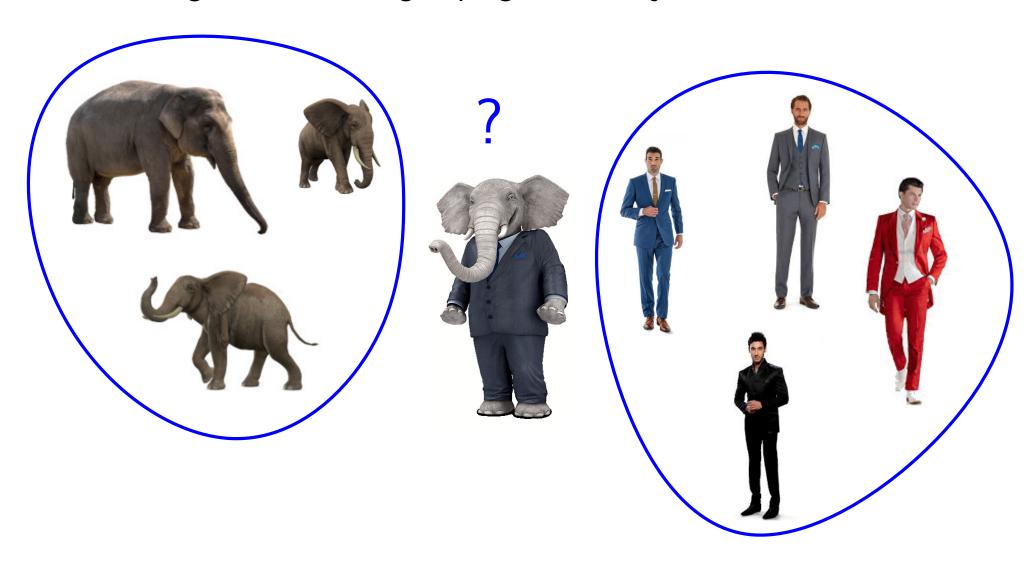

Clustering is the task of grouping similar objects into clusters

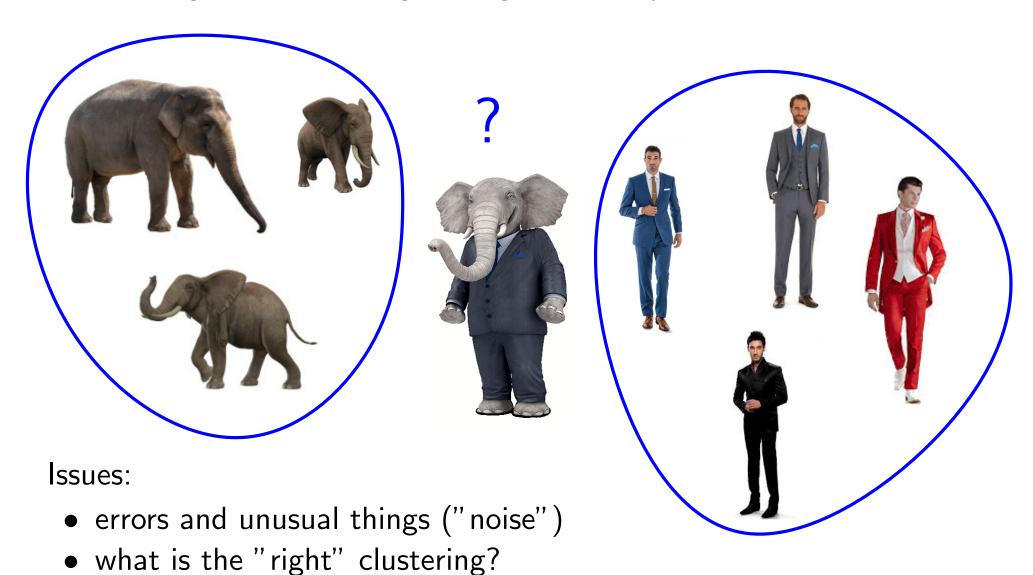

What is Clustering?

Clustering is the task of grouping similar objects into clusters

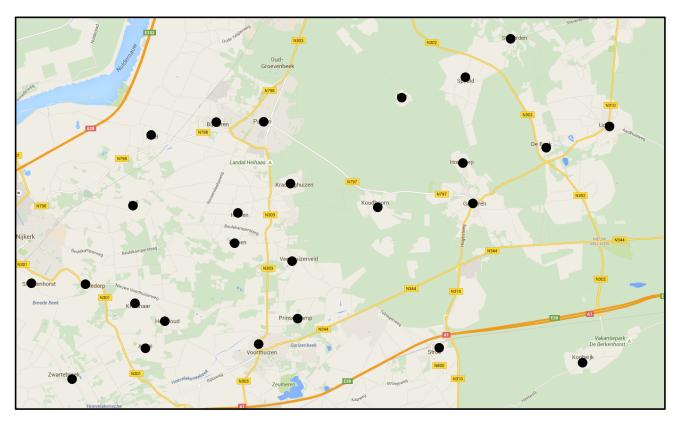

What is Clustering?

Clustering is the task of grouping similar objects into clusters

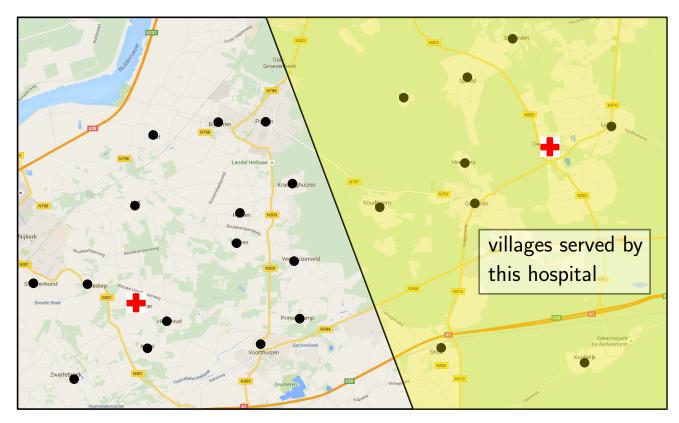

Facility Location

You may build two hospitals in two different villages serving the surrounding villages. Where do you place them to minimize the maximal distance from any village to its serving hospital?

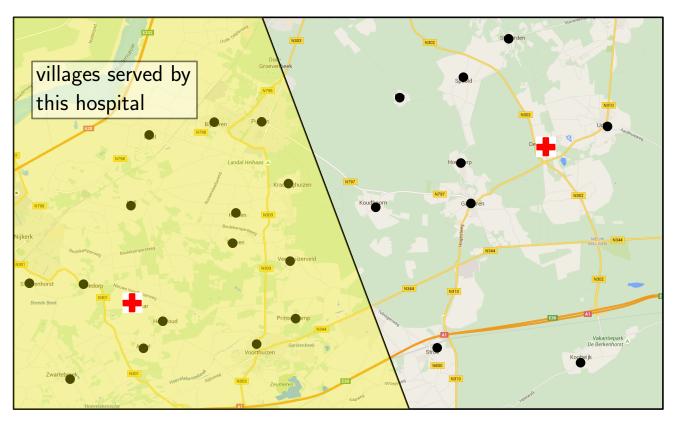

Facility Location

You may build two hospitals in two different villages serving the surrounding villages. Where do you place them to minimize the maximal distance from any village to its serving hospital?

Facility Location

You may build two hospitals in two different villages serving the surrounding villages. Where do you place them to minimize the maximal distance from any village to its serving hospital?

k-center clustering

Input: set of points $P = \{p_1, \dots, p_n\} \subseteq \mathbb{R}^d$, value of k

Output: set of centers $C = \{c_1, \ldots, c_k\} \subseteq P$

Problem:

• each $p_i \in P$ is "served by" its closest center

$$\underset{c_{i} \in C}{\operatorname{argmin}} \| p_{i} - c_{j} \|$$

- ullet all points served by a center c_j together form a "cluster"
- we want to choose $\{c_1, \ldots, c_k\}$ to minimize the cost function

$$\phi(P, C) = \max_{p_i \in P} \left\| p_i - \underset{c_j \in C}{\operatorname{argmin}} \| p_i - c_j \| \right\|$$

Input: set of points $P = \{p_1, \dots, p_n\} \subseteq \mathbb{R}^d$, value of k **Output:** set of centers $C = \{c_1, \dots, c_k\} \subseteq P$

Algorithm:

- choose an arbitrary point $p_i \in P$ and set $c_1 = p_i$
- for $t = 2, \ldots, k$ set

$$c_t = \underset{p_i \in P}{\operatorname{argmax}} \left\| p_i - \underset{c_j \in \{c_1, \dots, c_{t-1}\}}{\operatorname{argmin}} \| p_i - c_j \| \right\|$$

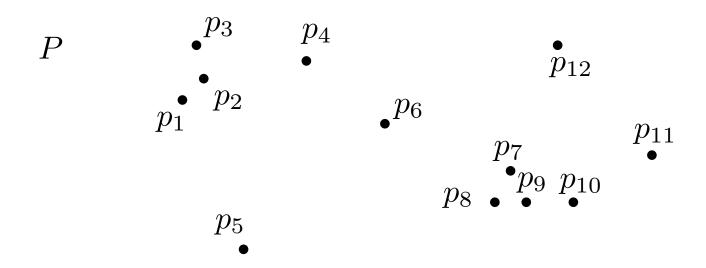

Input: set of points $P = \{p_1, \dots, p_n\} \subseteq \mathbb{R}^d$, value of k **Output:** set of centers $C = \{c_1, \dots, c_k\} \subseteq P$

Algorithm:

- choose an arbitrary point $p_i \in P$ and set $c_1 = p_i$
- for $t = 2, \ldots, k$ set

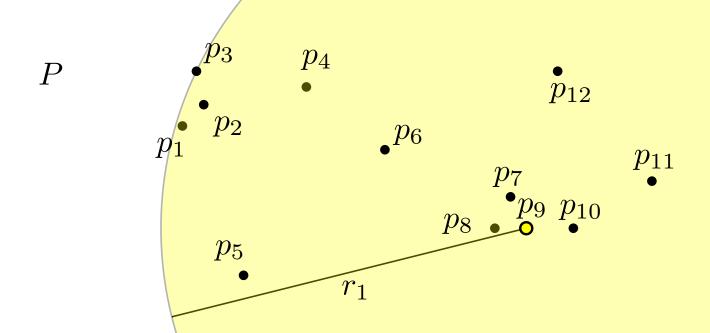

$$c_t = \underset{p_i \in P}{\operatorname{argmax}} \left\| p_i - \underset{c_j \in \{c_1, \dots, c_{t-1}\}}{\operatorname{argmin}} \left\| p_i - c_j \right\| \right\|$$

 $\phi(P,\{c_1,\ldots,c_t\})$ corresponds to the smallest radius such that all points are covered

 $\phi(P,\{c_1,\ldots,c_t\})$ corresponds to the smallest radius such that all points are covered

 $c_1 = p_9$

 $\phi(P,\{c_1,\ldots,c_t\})$ corresponds to the smallest radius such that all points are covered

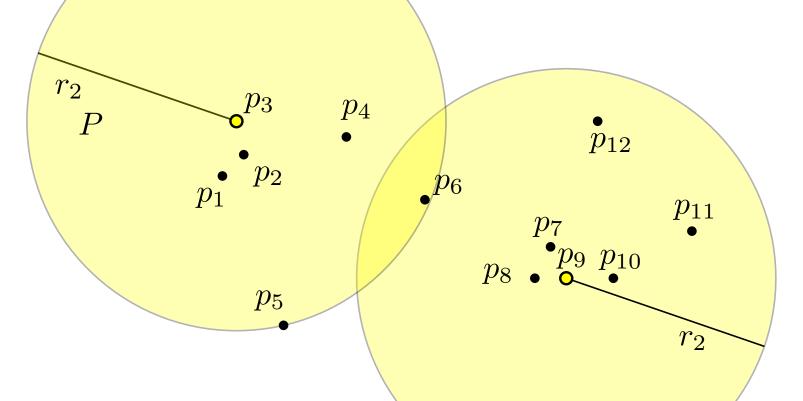

$$c_1 = p_9$$
$$c_2 = p_3$$

 $\phi(P, \{c_1, \dots, c_t\})$ corresponds to the smallest radius such that all points are covered

 $c_1 = p_9$

 $c_2 = p_3$

 $\phi(P, \{c_1, \dots, c_t\})$ corresponds to the smallest radius such that all points are covered

 $c_1 = p_9$

 $c_2 = p_3$

 $c_3 = p_5$

 $\phi(P, \{c_1, \dots, c_t\})$ corresponds to the smallest radius such that all points are covered

$$c_1 = p_9$$

$$c_2 = p_3$$

$$c_3 = p_5$$

 $\phi(P, \{c_1, \dots, c_t\})$ corresponds to the smallest radius such that all points are covered

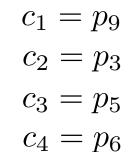

$$c_2 = p_3$$

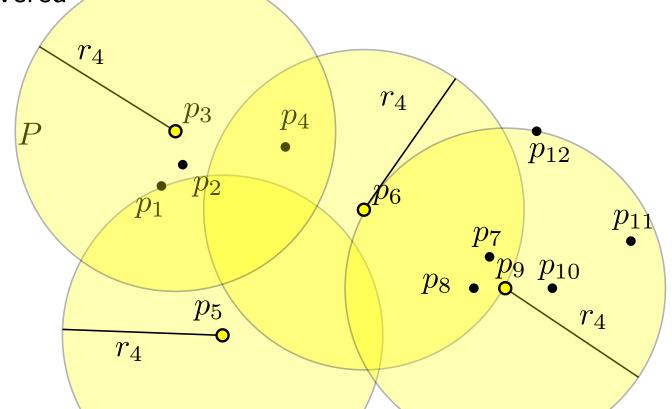

$$c_3 = p_5$$

$$c_4 = p_6$$

 $\phi(P,\{c_1,\ldots,c_t\})$ corresponds to the smallest radius such that all points are covered

 $\phi(P,\{c_1,\ldots,c_t\})$ corresponds to the smallest radius such that all points are covered

 $\phi(P,\{c_1,\ldots,c_t\})$ corresponds to the smallest radius such that all points are covered

 p_5

 r_5

 $p_{9} p_{10}$

 r_5

 $c_1 = p_9$

 $\phi(P,\{c_1,\ldots,c_t\})$ corresponds to the smallest radius such that all points are covered

 $c_1 = p_9$

"Farthest-first" greedy algorithm: always choose the point that maximizes the current cost $\phi(P, \{c_1, \ldots, c_t\})$

 r_5

 $\phi(P, \{c_1, \dots, c_t\})$ corresponds to the smallest radius such that all points are covered

 $c_1 = p_9$

 $c_2 = p_3$

Claim: $r_k \le 2\phi(P, C^*)$ (where C^* is an optimal solution)

Proof:

•

•

Claim: $r_k \leq 2\phi(P, C^*)$

(where C^* is an optimal solution)

$$\bullet c_1^*$$

Claim: $r_k \le 2\phi(P, C^*)$ (where C^* is an optimal solution)

$$(k = 1)$$

$$c_1^*$$

$$p_i$$

$$\forall p_i \in P: \|p_i - c_1\| \le \|p_i - c_1^*\| + \|c_1^* - c_1\|$$

Claim: $r_k \le 2\phi(P, C^*)$ (where C^* is an optimal solution)

$$(k = 1)$$

$$c_1^*$$

$$p_i$$

(Triangle inequality)
$$\forall p_i \in P: \qquad \|p_i - c_1\| \leq \|p_i - c_1^*\| + \|c_1^* - c_1\| \leq \phi(P, C^*) \leq \phi(P, C^*)$$

Claim: $r_k \le 2\phi(P, C^*)$ (where C^* is an optimal solution)

$$(k = 1)$$

$$c_1$$

$$p_i$$

(Triangle inequality)
$$\forall p_i \in P: \qquad \|p_i - c_1\| \leq \|p_i - c_1^*\| + \|c_1^* - c_1\| \leq 2\phi(P, C^*)$$

$$\leq \phi(P, C^*) \qquad \leq \phi(P, C^*)$$

Claim: $r_k \leq 2\phi(P, C^*)$ (where C^* is an optimal solution)

Proof:

$$(k=1)$$

$$c_1^*$$

$$c_1$$

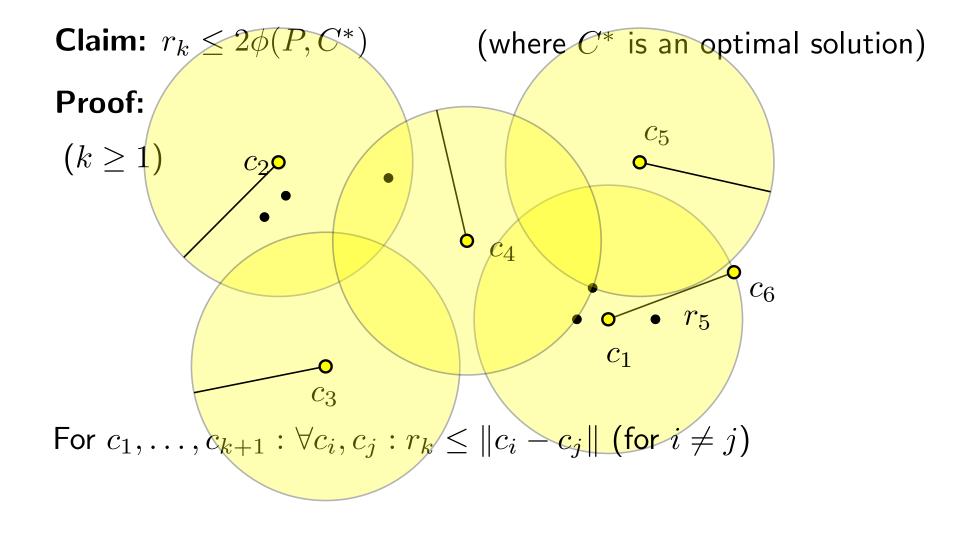

$$p_i$$

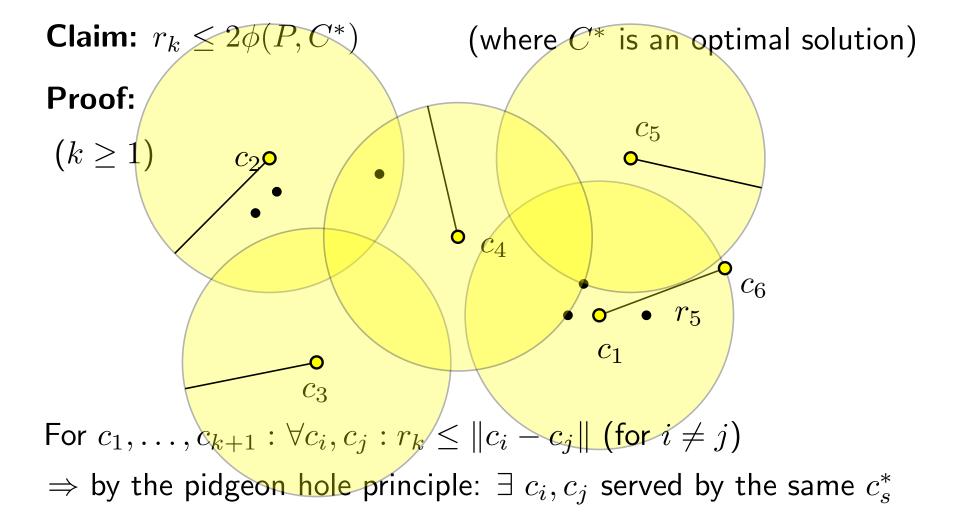

(Triangle inequality)

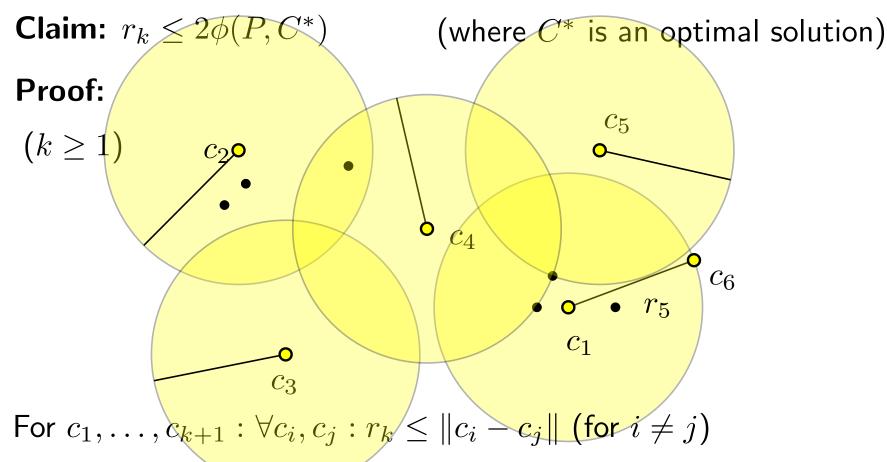

$$\forall p_i \in P: \qquad ||p_i - c_1|| \le ||p_i - c_1^*|| + ||c_1^* - c_1|| \le 2\phi(P, C^*)$$

$$\Rightarrow r_1 \le 2\phi(P, C^*)$$

2IMW30 Foundations of data mining

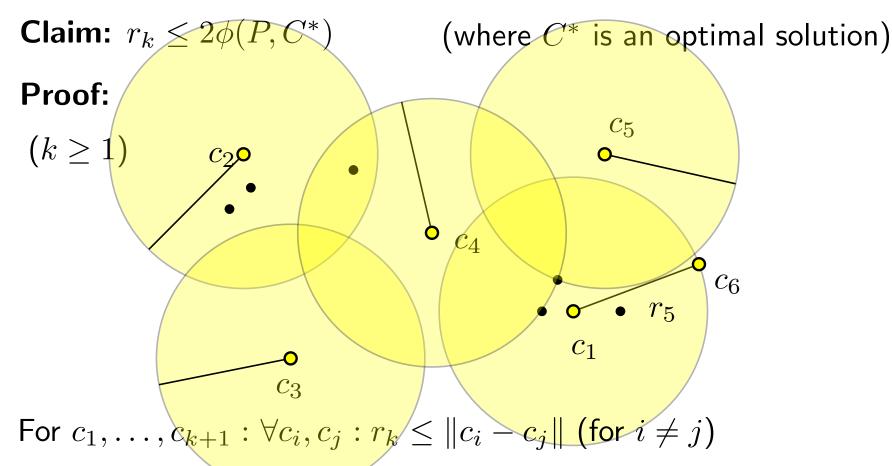

- \Rightarrow by the pidgeon hole principle: $\exists \ c_i, c_j$ served by the same c_s^*
- \Rightarrow by the triangle inequality for c_i, c_j, c_s^* :

$$||c_i - c_j|| \le ||c_i - c_s^*|| + ||c_s^* - c_j|| \le 2\phi(P, C^*)$$

- \Rightarrow by the pidgeon hole principle: $\exists \ c_i, c_j$ served by the same c_s^*
- \Rightarrow by the triangle inequality for c_i, c_j, c_s^* :

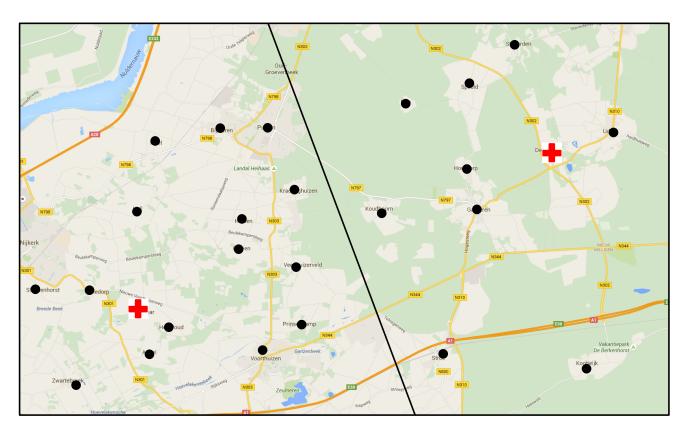

$$||c_i - c_j|| \le ||c_i - c_s^*|| + ||c_s^* - c_j|| \le 2\phi(P, C^*)$$

So we have $r_k \leq 2\phi(P, C^*)$

Facility Location (Variant)

You may build two hospitals in two different villages serving the surrounding villages. Where do you place them to minimize the maximal distance from any village to its serving hospital?

Variant: • minimize the (squared) average distance

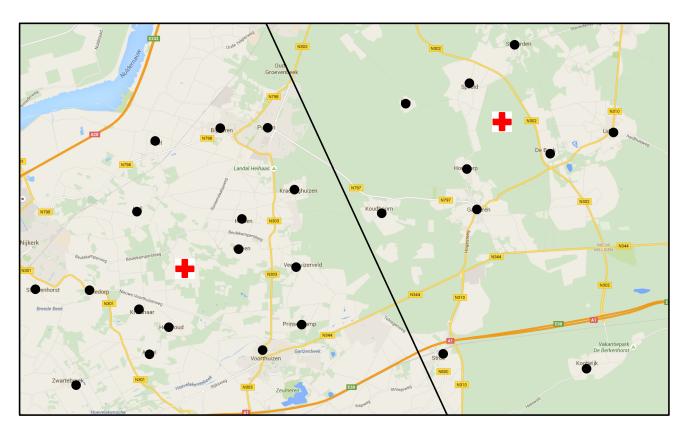

Facility Location (Variant)

You may build two hospitals in two different villages serving the surrounding villages. Where do you place them to minimize the maximal distance from any village to its serving hospital?

Variant:

- minimize the (squared) average distance
- hospitals may be built "in the middle of nowhere"

k-means clustering

Input: set of points $P = \{p_1, \dots, p_n\} \subseteq \mathbb{R}^d$, value of k

Output: set of centers $C = \{c_1, \ldots, c_k\} \subseteq \mathbb{R}^d$

Problem:

centers may be in the middle of nowhere

ullet each $p_i \in P$ is associated with its closest center

$$\underset{c_j \in C}{\operatorname{argmin}} \| p_i - c_j \|$$

ullet points associated with a center c_i together form a "cluster".

ullet we want to choose $\{c_1,\ldots,c_k\}$ to minimize the cost function

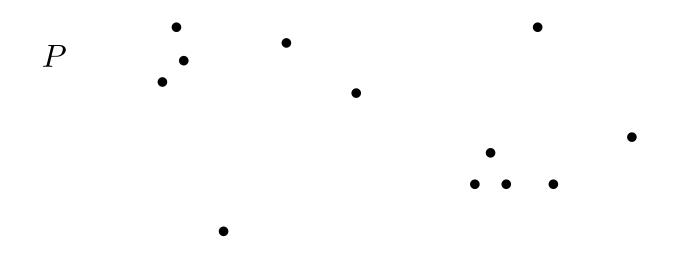

average instead of maximum
$$\phi(P,C) = \sum_{p_i \in P} \left\| p_i - \operatorname*{argmin}_{c_j \in C} \| p_i - c_j \| \right\|^2 \text{ (squared distance)}$$

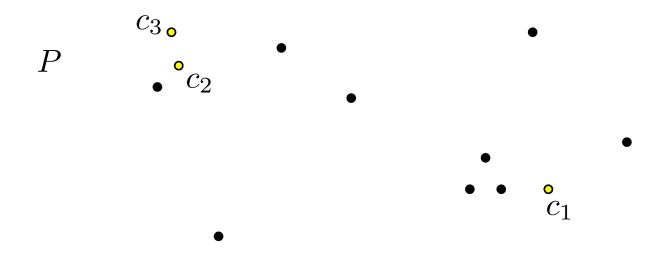

Input: set of points $P = \{p_1, \dots, p_n\} \subseteq \mathbb{R}^d$, value of k **Output:** set of centers $C = \{c_1, \dots, c_k\} \subseteq \mathbb{R}^d$

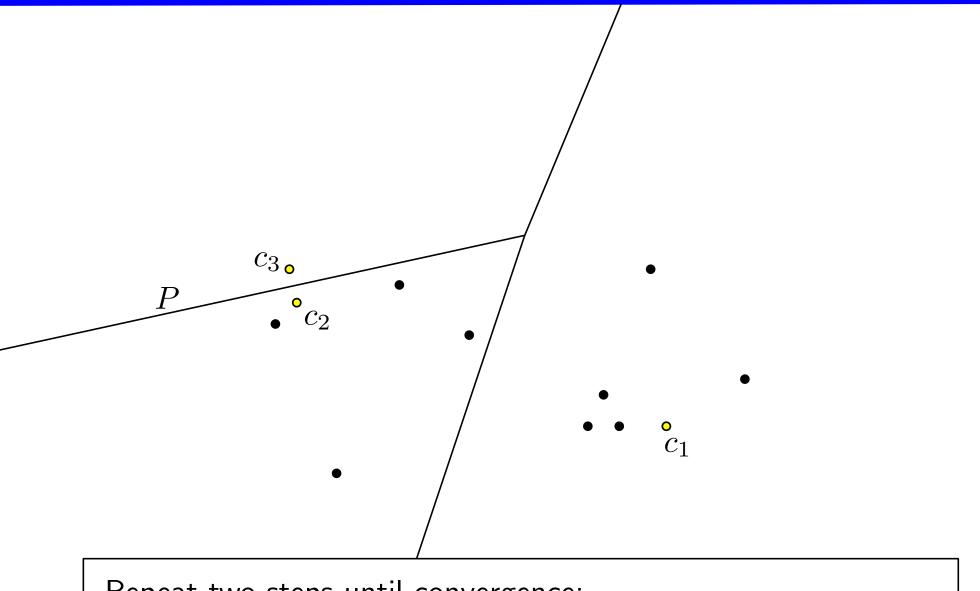

Algorithm:

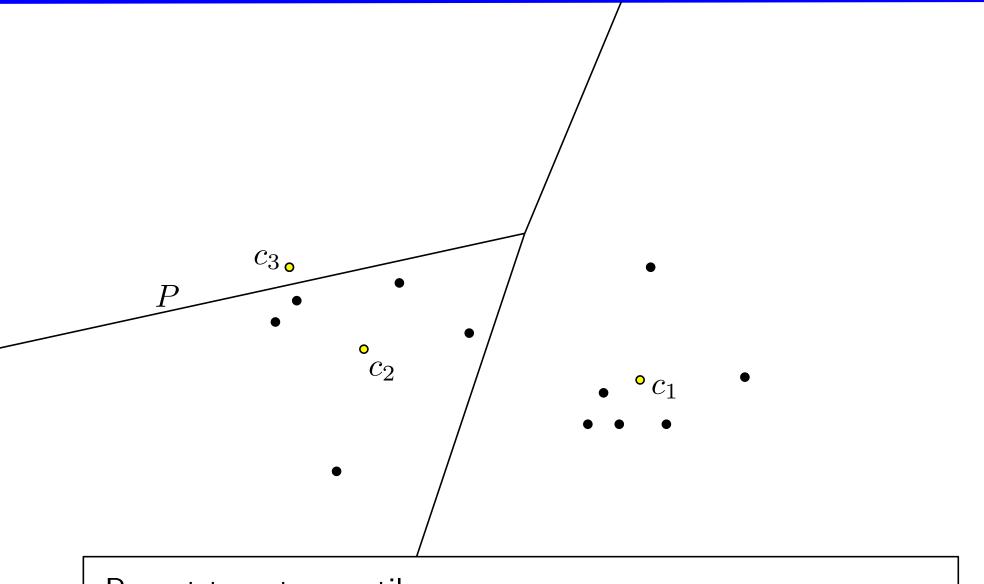

- ullet choose initial centers arbitrarily $\{c_1,\ldots,c_k\}$ from P
- until $\{c_1, \ldots, c_k\}$ does not change anymore:
 - (1) assign each $p_i \in P$ to its closest center
 - (2) update center for each cluster Θ_j :

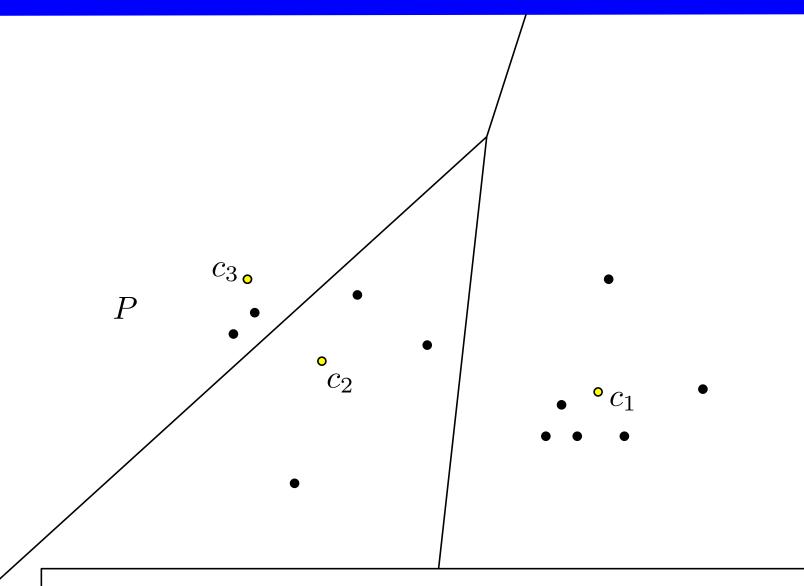

$$c_j := \frac{1}{m} \sum_{p_i \in \Theta_j} p_i$$

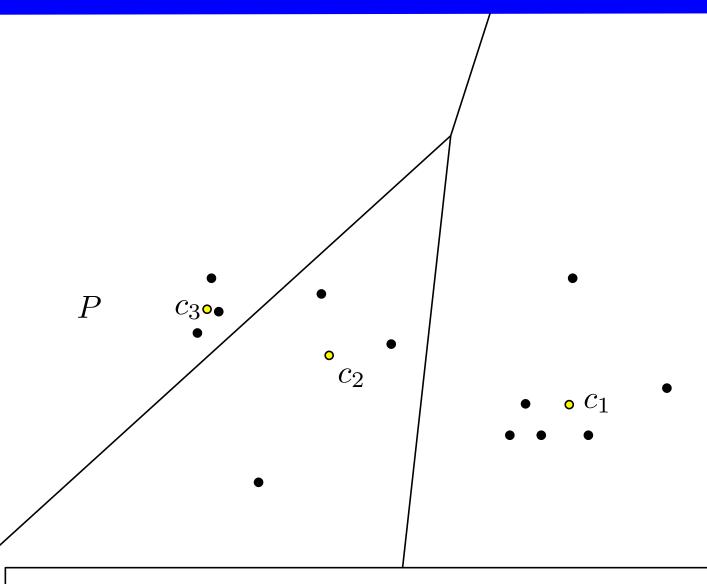

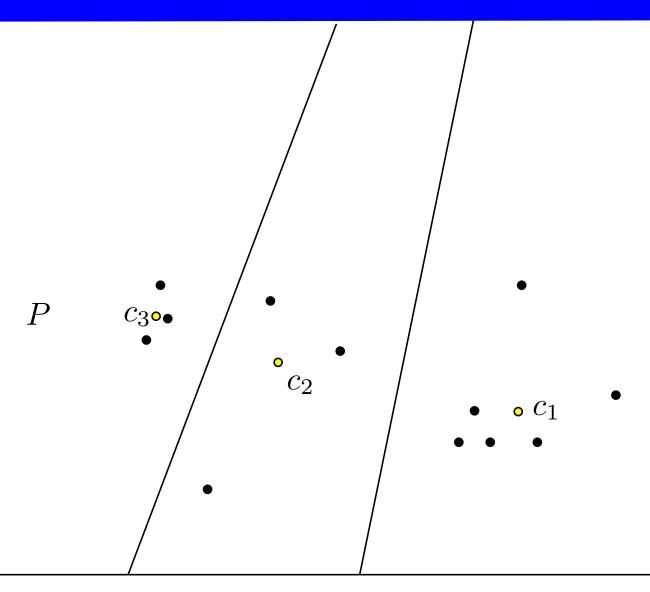

Claim:

$$\underset{c \in \mathbb{R}^d}{\operatorname{argmin}} \sum_{p_i \in P} ||p_i - c||^2 = \frac{1}{n} \sum_{i=1}^n p_i$$

$$\underset{c \in \mathbb{R}^d}{\operatorname{argmin}} \sum_{p_i \in P} ||p_i - c||^2 = \frac{1}{n} \sum_{i=1}^n p_i$$

Proof: Let
$$\overline{p} := \frac{1}{n} \sum_{i=1}^{n} p_i$$

$$\sum_{i=1}^{n} ||p_i - c||^2 = \sum_{i=1}^{n} ||p_i - \overline{p} + \overline{p} - c||^2$$

$$\underset{c \in \mathbb{R}^d}{\operatorname{argmin}} \sum_{p_i \in P} ||p_i - c||^2 = \frac{1}{n} \sum_{i=1}^n p_i$$

Proof: Let
$$\overline{p} := \frac{1}{n} \sum_{i=1}^{n} p_i$$

$$\sum_{i=1}^{n} ||p_i - c||^2 = \sum_{i=1}^{n} ||p_i - \overline{p} + \overline{p} - c||^2$$

$$= \sum_{i=1}^{n} \sum_{j=1}^{d} (p_{ij} - \overline{p}_j + \overline{p}_j - c_j)^2$$

$$\underset{c \in \mathbb{R}^d}{\operatorname{argmin}} \sum_{p_i \in P} ||p_i - c||^2 = \frac{1}{n} \sum_{i=1}^n p_i$$

Proof: Let
$$\overline{p} := \frac{1}{n} \sum_{i=1}^{n} p_i$$

$$\sum_{i=1}^{n} \|p_i - c\|^2 = \sum_{i=1}^{n} \|p_i - \overline{p} + \overline{p} - c\|^2$$

$$= \sum_{i=1}^{n} \sum_{j=1}^{d} (p_{ij} - \overline{p}_j + \overline{p}_j - c_j)^2$$

$$= \sum_{i=1}^{n} \sum_{j=1}^{d} ((p_{ij} - \overline{p}_j)^2 + 2(p_{ij} - \overline{p}_j)(\overline{p}_j - c_j) + (\overline{p}_j - c_j)^2)$$

$$\underset{c \in \mathbb{R}^d}{\operatorname{argmin}} \sum_{p_i \in P} ||p_i - c||^2 = \frac{1}{n} \sum_{i=1}^n p_i$$

Proof: Let
$$\overline{p} := \frac{1}{n} \sum_{i=1}^{n} p_i$$

$$\sum_{i=1}^{n} \|p_i - c\|^2 = \sum_{i=1}^{n} \|p_i - \overline{p} + \overline{p} - c\|^2$$

$$= \sum_{i=1}^{n} \sum_{j=1}^{d} (p_{ij} - \overline{p}_j + \overline{p}_j - c_j)^2$$

$$= \sum_{i=1}^{n} \sum_{j=1}^{d} ((p_{ij} - \overline{p}_j)^2 + 2(p_{ij} - \overline{p}_j)(\overline{p}_j - c_j) + (\overline{p}_j - c_j)^2)$$

$$= \sum_{i=1}^{n} \|p_i - \overline{p}\|^2 + 2\sum_{i=1}^{n} \langle p_i - \overline{p}, \overline{p} - c \rangle + n \cdot \|\overline{p} - c\|^2$$

Claim:

$$\underset{c \in \mathbb{R}^d}{\operatorname{argmin}} \sum_{p_i \in P} ||p_i - c||^2 = \frac{1}{n} \sum_{i=1}^n p_i$$

Proof: Let
$$\overline{p} := \frac{1}{n} \sum_{i=1}^{n} p_i$$

$$\sum_{i=1}^{n} \|p_{i} - c\|^{2} = \sum_{i=1}^{n} \|p_{i} - \overline{p} + \overline{p} - c\|^{2}$$

$$= \sum_{i=1}^{n} \sum_{j=1}^{d} (p_{ij} - \overline{p}_{j} + \overline{p}_{j} - c_{j})^{2}$$

$$= \sum_{i=1}^{n} \sum_{j=1}^{d} ((p_{ij} - \overline{p}_{j})^{2} + 2(p_{ij} - \overline{p}_{j})(\overline{p}_{j} - c_{j}) + (\overline{p}_{j} - c_{j})^{2})$$

$$= \sum_{i=1}^{n} \|p_{i} - \overline{p}\|^{2} + 2\sum_{i=1}^{n} \langle p_{i} - \overline{p}, \overline{p} - c \rangle + n \cdot \|\overline{p} - c\|^{2}$$

$$= \sum_{i=1}^{n} \|p_{i} - \overline{p}\|^{2} + 2\left(\sum_{i=1}^{n} p_{i} - n \cdot \overline{p}, \overline{p} - c\right) + n \cdot \|\overline{p} - c\|^{2}$$

Claim:

$$\underset{c \in \mathbb{R}^d}{\operatorname{argmin}} \sum_{p_i \in P} ||p_i - c||^2 = \frac{1}{n} \sum_{i=1}^n p_i$$

Proof:

Let
$$\overline{p}:=rac{1}{n}\sum_{i=1}^n p_i$$

$$\sum_{i=1}^{n} \|p_{i} - c\|^{2} = \sum_{i=1}^{n} \|p_{i} - \overline{p} + \overline{p} - c\|^{2}$$

$$= \sum_{i=1}^{n} \sum_{j=1}^{d} (p_{ij} - \overline{p}_{j} + \overline{p}_{j} - c_{j})^{2}$$

$$= \sum_{i=1}^{n} \sum_{j=1}^{d} ((p_{ij} - \overline{p}_{j})^{2} + 2(p_{ij} - \overline{p}_{j})(\overline{p}_{j} - c_{j}) + (\overline{p}_{j} - c_{j})^{2})$$

$$= \sum_{i=1}^{n} \|p_{i} - \overline{p}\|^{2} + 2\sum_{i=1}^{n} \langle p_{i} - \overline{p}, \overline{p} - c \rangle + n \cdot \|\overline{p} - c\|^{2}$$

$$= \sum_{i=1}^{n} \|p_{i} - \overline{p}\|^{2} + 2\left\langle \sum_{j=1}^{n} p_{i} - n \cdot \overline{p}, \overline{p} - c \right\rangle + n \cdot \|\overline{p} - c\|^{2}$$

Claim:

$$\underset{c \in \mathbb{R}^d}{\operatorname{argmin}} \sum_{p_i \in P} ||p_i - c||^2 = \frac{1}{n} \sum_{i=1}^n p_i$$

Proof: (continued)

$$\sum_{i=1}^{n} ||p_i - c||^2 = \sum_{i=1}^{n} ||p_i - \overline{p}||^2 + n \cdot ||\overline{p} - c||^2$$

Claim:

$$\underset{c \in \mathbb{R}^d}{\operatorname{argmin}} \sum_{p_i \in P} ||p_i - c||^2 = \frac{1}{n} \sum_{i=1}^n p_i$$

Proof: (continued)

$$\sum_{i=1}^{n} \|p_i - c\|^2 = \sum_{i=1}^{n} \|p_i - \overline{p}\|^2 + n \cdot \|\overline{p} - c\|^2$$

right hand side is minimized for $c=\overline{p}$

Does the algorithm always converge?

Does the algorithm always converge?

Yes, because:

- ullet each step decreases the cost $\phi(P,C)$
- there exists only a finite number of cluster assignments
- the computed centers are optimal for the current assignment.

Does the algorithm always converge?

Yes, because:

- ullet each step decreases the cost $\phi(P,C)$
- there exists only a finite number of cluster assignments
- the computed centers are optimal for the current assignment.

Does it always converge to an optimal solution?

Does the algorithm always converge?

Yes, because:

- ullet each step decreases the cost $\phi(P,C)$
- there exists only a finite number of cluster assignments
- the computed centers are optimal for the current assignment.

Does it always converge to an optimal solution?

No, can get stuck in local minima.

 p_1

Does the algorithm always converge?

Yes, because:

- ullet each step decreases the cost $\phi(P,C)$
- there exists only a finite number of cluster assignments

k-means++ Algorithm

For general k, the solution obtained by k-means++ will, in expectation, be at most a factor $O(\log k)$ worse than the optimal solution.

k-means++ Algorithm

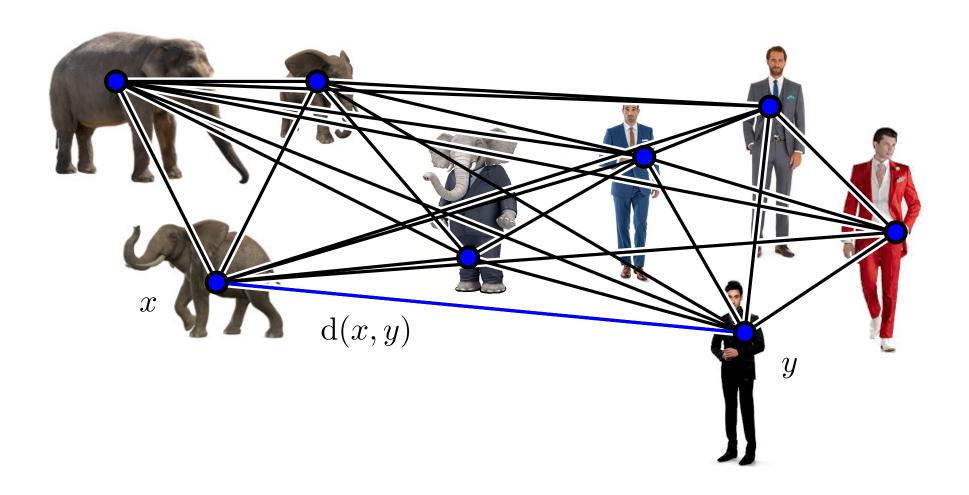

For general k, the solution obtained by k-means++ will, in expectation, be at most a factor $O(\log k)$ worse than the optimal solution.

Gonzales' algorithm and k-means++:

- Gonzales: choose the next center from P as the point that maximizes the current cost
- **k-means++**: choose the next center from P with probability relative to the contribution to the current cost

Clustering in Graphs

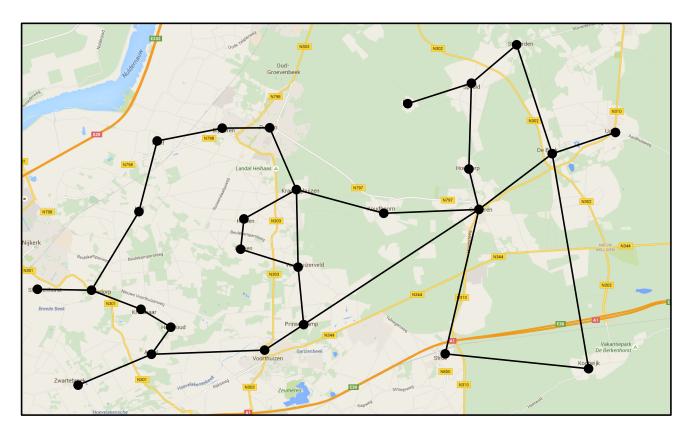

- Vertices of the graph represent the objects to be clustered
- Distance is measured by shortest path

Facility Location with Road Network

You may build two hospitals in two different villages serving the surrounding villages. Where do you place them to minimize the maximal distance from any village to its serving hospital?

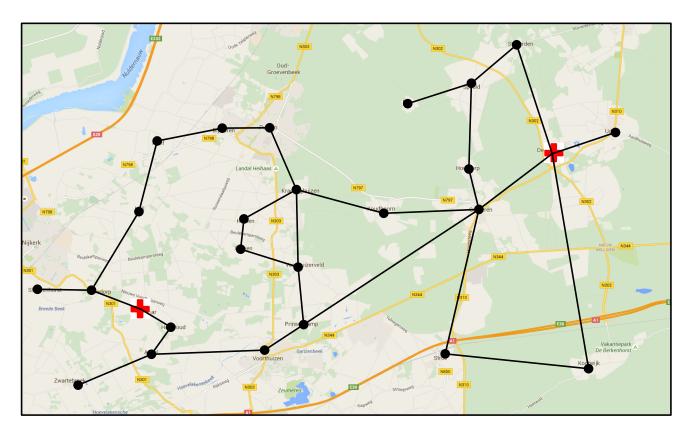

Variant: Measure distance along the road network (travel distance).

Facility Location with Road Network

You may build two hospitals in two different villages serving the surrounding villages. Where do you place them to minimize the maximal distance from any village to its serving hospital?

Variant: Measure distance along the road network (travel distance).

Summary

- Clustering
- Facility Location
- Gonzales' algorithm
- Lloyd's algorithm (k-means)
- k-means++ algorithm
- Clustering in graphs
